Ex6.

↳ first we create integer array of Length 10.

↳ then we pass it to method One, which takes the given array and sets it equal to array b of length 5.
then the method prints out the lengths of both arrays $a.length = 5$ $b.length = 5$.

Then in the main we print out the length of unchanged array a ; $a.length = 10$
Therefore the output is 5 5 10.
